XIPLINK ANNOUNCES SALE OF TCP ACCELERATION TECHNOLOGY TO ALCATEL SPACE

SATELLITE 2005, WASHINGTON DC – XipLink Networking announced today the sale of XipLink Gateway performance enhancing systems to Alcatel Space. This technology provides a key role in enabling true broadband network access over satellite networks. The first of the gateways have recently been installed in the Middle East and the second will be installed shortly in Northern Africa.

The innovative new technology optimizes TCP/IP and HTTP traffic at the hub of satellite network only. With no performance enhancing proxy installed within the current generation of remote terminals, a high performance solution is made possible through use of the “XipLink Hub Optimized Gateway” and optionally an automated script that assists in tuning the client’s PC. The system consists of a forward channel of 45Mbps and return channel of up to 20Mbps.

XipLink technology provides a maximized broadband experience for users and makes the most of expensive satellite bandwidth. Bridging communications through XipLink Gateways optimize highly interactive protocols such as HTTP with special handling by transparently utilizing specialized algorithms to manage the data transport.

XipLink provides the highest performance implementation of the SCPS-TP standard recognized by ISO and other standards organizations including the US Military. SCPS-TP extends TCP with improved congestion control, error handling and efficiency. XipLink also includes additional link enhancements such as technology specifically targeted at transparently accelerating the web browsing responsiveness and media-rich page download time, providing a DSL-like experience over satellite.

About XipLink Networking and Xiphos Technologies

XipLink Networking, a subsidiary of Xiphos Technologies Inc. (XTI), is focused on taking a leading role in the adaptation of Internet Protocols for stressed communication links. XipLink technology is sold worldwide via COTS Gateways or licensed for OEM integration. XTI is a privately owned Canadian company that is adapting network concepts for communications and control in space and in other stressed environments.
